

Product Vision & Core Value Prop

What it does

DocQuery turns any private PDF or note collection into a queryable knowledge base. Users upload their documents, ask questions in plain language, and get answers that are pulled directly from the source material — with the exact page cited for every claim. No answer is ever generated from the model's general knowledge alone; if the documents don't cover something, DocQuery says so instead of guessing.

Why it exists

Students and professionals don't have a "search" problem, they have a "trust" problem. Ctrl+F and manual skimming are slow but at least accurate; general-purpose AI chatbots are fast but can confidently invent answers that aren't actually in the source. Neither option gives someone the speed of AI with the reliability of going straight to the page.

DocQuery exists to close that gap: the speed of asking a question in plain language, combined with the trustworthiness of a citation you can click and verify yourself.

Core value proposition

For students and early-career professionals drowning in unstructured PDFs, DocQuery is a document Q&A assistant that gives grounded, page-cited answers instead of generic or hallucinated ones — unlike general AI chatbots, which have no access to private documents and no way to prove where an answer came from.

One-line pitch

"Ask your documents anything — and know exactly where the answer came from."
